# Problem of the Week Problem D and Solution <br> <br> Head Start 

 <br> <br> Head Start}

## Problem

Gabi and Silvio are training for a cycling race. They live on the same street, but Silvio's house is 2 km east of Gabi's. On Sunday morning at 7 a.m. they each start biking east from their house. If Gabi bikes at a constant speed of $24 \mathrm{~km} / \mathrm{h}$ and Silvio bikes at a constant speed of $18 \mathrm{~km} / \mathrm{h}$, at what time will Gabi catch up to Silvio?

## Solution

For the first two solutions we will use the formula: time $=\frac{\text { distance }}{\text { speed }}$.
For the third solution we will use the formula: distance $=$ speed $\times$ time.

## Solution 1

Since Gabi bikes at $24 \mathrm{~km} / \mathrm{h}$ and Silvio bikes at $18 \mathrm{~km} / \mathrm{h}$, then Gabi gains $6 \mathrm{~km} / \mathrm{h}$ on Silvio.

Since Silvio starts 2 km east of of Gabi, then it takes Gabi $\frac{2}{6}=\frac{1}{3}$ of an hour or $\frac{1}{3} \times 60=20$ minutes to catch up to Silvio. Since they started biking at 7 a.m., Gabi will catch up to Silvio at 7:20 a.m.

## Solution 2

Silvio bikes at $18 \mathrm{~km} / \mathrm{h}$ or $\frac{18}{60}=\frac{3}{10} \mathrm{~km} / \mathrm{min}$. Gabi bikes at $24 \mathrm{~km} / \mathrm{h}$ or $\frac{24}{60}=\frac{2}{5} \mathrm{~km} / \mathrm{min}$. Therefore Gabi gains $\frac{2}{5}-\frac{3}{10}=\frac{1}{10} \mathrm{~km} / \mathrm{min}$ on Silvio.
Since Silvio started 2 km east of Gabi, then it takes Gabi $2 \div \frac{1}{10}=20$ minutes to catch Silvio. Since they started biking at 7 a.m., Gabi will catch up to Silvio at 7:20 a.m.

## Solution 3

Suppose it takes $t$ hours for Gabi to catch up to Silvio. Then Silvio has biked $18 \mathrm{~km} / \mathrm{h} \times t \mathrm{~h}=18 t \mathrm{~km}$, and Gabi has biked $24 \mathrm{~km} / \mathrm{h} \times t \mathrm{~h}=24 t \mathrm{~km}$.

Since Silvio starts 2 km east of Gabi, then when they meet, Gabi will have travelled 2 km further than Silvio. That is,

$$
\begin{aligned}
24 t & =18 t+2 \\
6 t & =2 \\
t & =\frac{1}{3}
\end{aligned}
$$

Therefore, it takes Gabi $\frac{1}{3}$ of an hour, or 20 minutes to catch up to Silvio. Since they started biking at 7 a.m., Gabi will catch up to Silvio at 7:20 a.m.
